Ábra 3. Ürülékben található *Campylobacter jejuni* baktériumok pásztázó elektronmikroszkópos képe (23).

Történelem: Először 1973-ban írták le *Campylobacter* nemzetséget, amelyet akkor *vibrio*-szerű organizmusnak neveztek el. Később kiderült, hogy a genom 62, 53, 50, 39, 257 21 és 19 kilodaltons közötti plazmidokat tartalmaz *Cambylobacters* (17-20).

Jelentősége: A *Campylobacter jejuni* a világ egyik vezető bakteriális okozója a gyomor-bélrendszeri betegségeknek, amelyek a fejlődő országokban a gyermekhalandóság jelentős részét okozzák (24). A *Campylobacter* fertőzés leggyakrabban a baromfi, kevésbé gyakran a szarvasmarha, juh, kutya és macska fertőzött ürülékével szennyezett élelmiszer vagy víz fogyasztásával terjed. Ázsiában, Afrikában és Latin-Amerikában a fejlődő országokban a gyermekek körében a hasmenéses megbetegedések egyik leggyakoribb okozója. A *Campylobacter jejuni* (25;25). Ezért is fontos, hogy a fejlődő országokban a fertőzés terjedésének megakadályozása érdekében a szennyvíz kezelésére nagy hangsúlyt fektessenek, mivel a szennyvíz a baromfi, szarvasmarha, juh, kutya és macska ürülékével szennyezett élelmiszer és víz fogyasztásával terjed, ami a fejlődő országokban a gyermekek körében a hasmenéses megbetegedések egyik leggyakoribb okozója. A *Campylobacter jejuni* DNA szekvenálása során kiderült, hogy a genom 1,6 millió bázispárból áll (26).

2. Методы исследования

Для решения поставленных задач нами было обследовано 30 больных с ишемическим инсультом в бассейне средней мозговой артерии (27). Все больные были обследованы в остром периоде заболевания (в среднем на 5-7 день от начала заболевания). Все больные были обследованы неврологически, нейропсихологически, с использованием шкалы инсульта Национального института здоровья США, шкалы Рэнкина, индекса Бартел, а также с использованием нейровизуализационных методов исследования (КТ и МРТ головного мозга).

Таблица 2.

Методика	Средний балл (%)	Средний балл (%)	Время выполнения	Чувствительность*
-Тест Шульте	77-92	100	Нет	+++
-Корректурная проба	93-99	95-99	Нет	+++
-Проба Бурдона	88-99	86-95	Да	+
-CLO-test	89-98	93-98	Нет	+
-^{13}С-дыхательная проба	90-100	98-100	Да	+++
-^{14}С-дыхательная проба	90-97	89-100	Да	++

Для выявления: +++ = высокая, ++ = средняя, + = низкая

*по данным исследователей, использовавших данную методику.

Таблица 2. Диагностическая ценность различных методов исследования при хеликобактерной инфекции (по данным Brown и Peura (28)).

Тест Шульте

Тест Шульте был предложен немецким психиатром Вальтером Шульте для исследования внимания (29). Методика теста: на листе бумаги в случайном порядке расположены числа от 1 до 25. Задача испытуемого – найти и показать все числа по порядку. Время выполнения теста фиксируется. Тест Шульте используется для исследования концентрации внимания, его устойчивости, переключаемости, а также скорости зрительного восприятия. Для оценки результатов теста Шульте используется таблица, в которой указаны возрастные нормы времени выполнения теста (30-32).

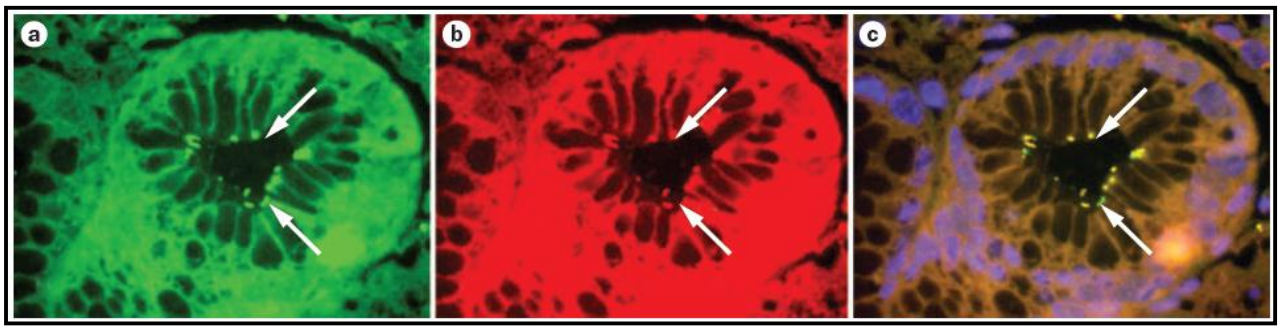
Малюнок 5. Різні види Warthin-Starry (срібне просочення) забарвлення *H. pylori* у біоптатах слизової оболонки шлунка. Зображення взяті з роботи Giemsa та співавт. (збільшення 1000×) [37].



Малюнок 6. Метод FISH. Різні штами *H. pylori* (a, b, c) та їхня ультраструктура (d, e, f). Зображення взяті з роботи Rimbara та співавт.[40]

Вплив антибіотиків на ультраструктуру

Ще одним важливим аспектом є вплив антибіотиків на ультраструктуру *H. pylori*. Відомо, що деякі штами можуть набувати стійкості до антибіотиків, що ускладнює лікування інфекції. Дослідження показують, що зміни в ультраструктурі можуть бути пов'язані з механізмами стійкості, такими як зміни в клітинній стінці або мембранних білках [28;42-45]. Ці зміни можуть впливати на ефективність антибіотичної терапії, оскільки вони можуть знижувати проникність антибіотиків або змінювати їхню мішень. Таким чином, вивчення ультраструктурних змін у штамах, стійких до антибіотиків, є важливим для розробки нових стратегій лікування та покращення існуючих протоколів терапії [46].

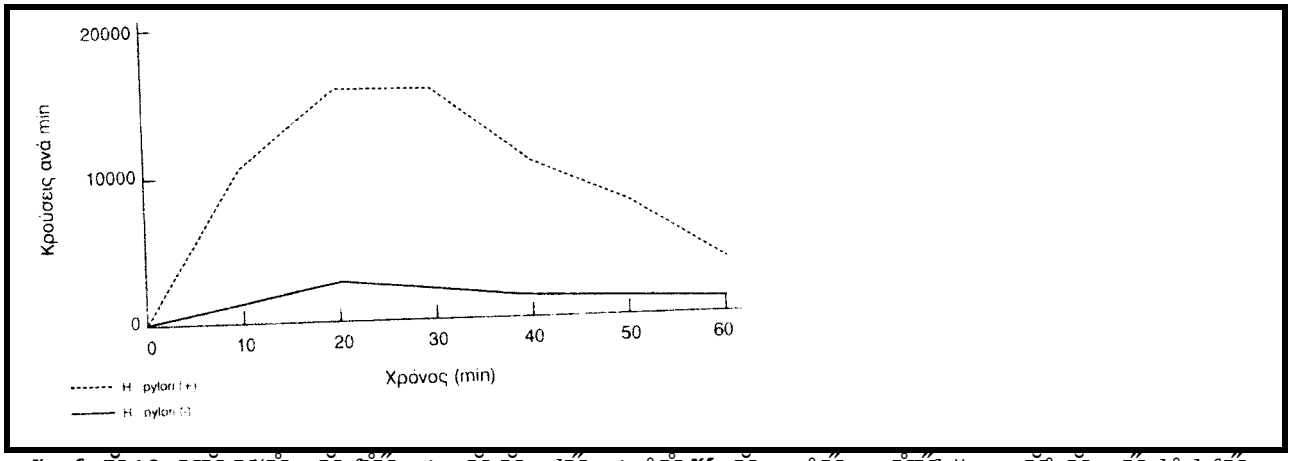
Άσκηση 9. Εξετάστε τον τρόπο με τον οποίο η ουρεάση του *Η. pylori* μπορεί να χρησιμοποιηθεί για τη διάγνωση της λοίμωξης από το βακτήριο αυτό.



Άσκηση 10. Η ουρεάση του *Η. pylori* και η ουρεάση της φασολιάς έχουν παρόμοια δομή. Συγκρίνετε τη δράση της ουρεάσης του *Η. pylori* με τη δράση της $^{14}CO_2$.

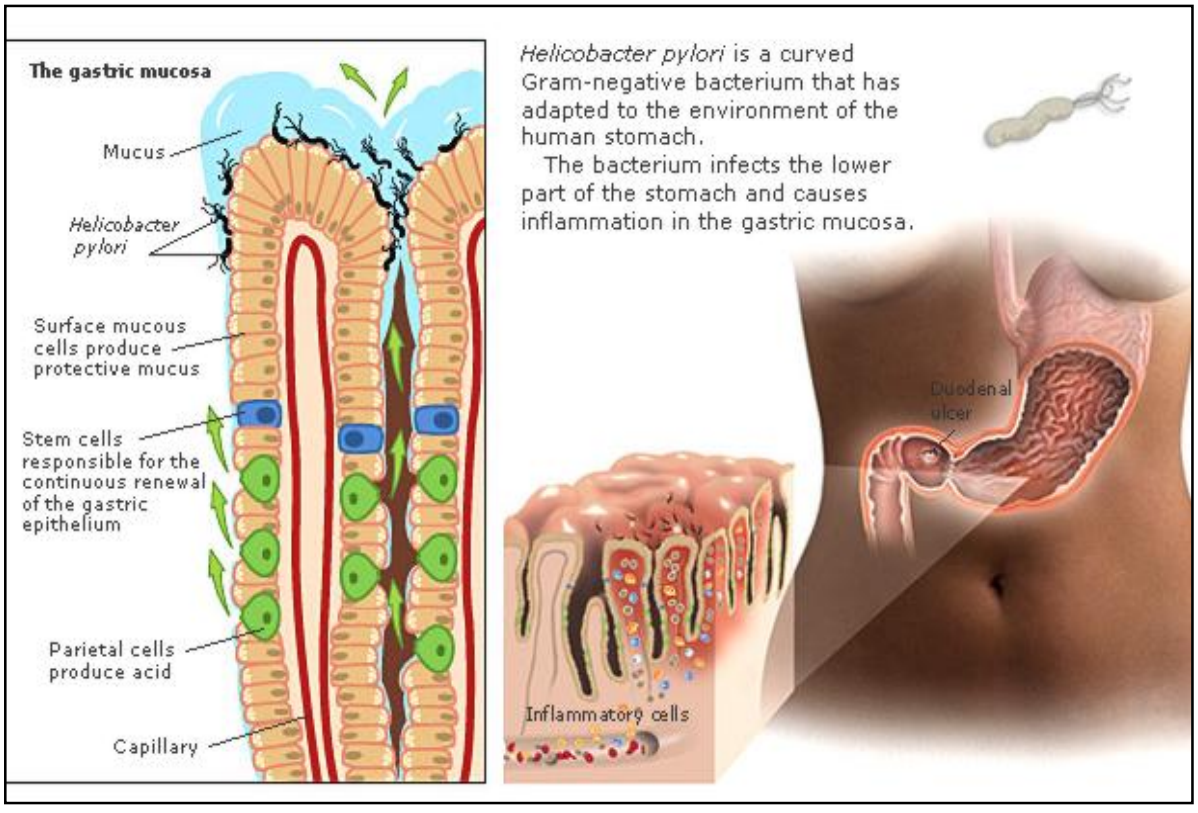
11. <u>Helicobacter pylori-нің ашылуы және оның ғылымдағы маңызы</u>

<u>Австралиялық Sydney қаласында</u>

1982 жылы Австралияның Перт қаласында ауруханада жұмыс істейтін екі дәрігер Робин Уоррен және Барри Маршалл ауруханаға түскен науқастардың асқазанынан алынған биопсия материалдарын зерттеу барысында, асқазан қабынуы және ойық жара ауруларының себебі ретінде **Helicobacter pylori** бактериясын ашты. Бұл ашылу медицина ғылымында үлкен революция жасады. Ғалымдар бұрын асқазан қышқылының көптігі, стресс және дұрыс тамақтанбау ойық жара ауруының негізгі себептері деп ойлаған болатын. Ал Helicobacter pylori ашылғаннан кейін, бұл ауруларды емдеу әдістері түбегейлі өзгерді. Ғалымдардың бұл ашылуы үшін 2005 жылы Нобель сыйлығы берілді[341]. Қазіргі кезде, бұл ашылуға байланысты Австралияда Helicobacter pylori ашылған күнін ерекше атап өтеді[342;343]. Бұл ашылу ғылымда **Helicobacter pylori** деп аталады[344].



Ашылуы 15. Helicobacter pylori бактериясының құрылысы

H. pylori Ag-ning virulent shtammlari

To'liq CagA oqsili [345;346]. Ushbu gen bilan kodlanadigan oqsil 1186 aminokislotadan iborat bo'lib, molekulyar massasi 120-140 kDa ni tashkil etadi. Ushbu oqsil oshqozon epiteliy hujayralarida kuchli immunogen xususiyatga ega. Ushbu oqsilga nisbatan hosil bo'lgan antitanachalar oshqozon yarasi va oshqozon saratoni bilan kasallangan bemorlarda yuqori titrda aniqlanadi. CagA oqsilining C-terminal qismi turli xil shtammlarda bir-biridan farq qiladi. Ushbu qism oqsilning immunogen xususiyatini belgilaydi. CagA oqsilining N-terminal qismi esa barcha shtammlarda deyarli bir xil bo'lib, u oqsilning biologik faolligini ta'minlaydi. CagA oqsilining N-terminal qismi hujayra ichiga kirib, hujayra ichidagi signal yo'llarini o'zgartiradi. Bu esa hujayraning normal faoliyatini buzadi [347-350]. CagA oqsilining C-terminal qismi esa hujayra membranasiga yopishib, hujayra membranasining o'tkazuvchanligini oshiradi. Bu esa hujayra ichiga turli xil moddalarning kirishini osonlashtiradi. CagA oqsilining C-terminal qismi hujayra ichidagi signal yo'llarini o'zgartirib, hujayraning o'sishini va bo'linishini tezlashtiradi. Bu esa saratonning rivojlanishiga olib keladi [351]. CagA oqsilining C-terminal qismi hujayra membranasiga yopishganda, hujayra membranasining o'tkazuvchanligini oshiradi. Bu esa hujayra ichiga turli xil moddalarning kirishini osonlashtiradi. Bu esa hujayraning normal faoliyatini buzadi. CagA oqsilining C-terminal qismi hujayra ichidagi signal yo'llarini o'zgartirib, hujayraning o'sishini va bo'linishini tezlashtiradi. Bu esa saratonning rivojlanishiga olib keladi [352;353]. CagA oqsilining C-terminal qismi hujayra ichiga kirganda, u hujayra ichidagi signal yo'llarini o'zgartiradi. Bu esa hujayraning normal faoliyatini buzadi. Bu esa saratonning rivojlanishiga olib keladi. CagA oqsilining C-terminal qismi hujayra ichiga kirganda, u hujayra ichidagi signal yo'llarini o'zgartiradi. Bu esa hujayraning normal faoliyatini buzadi. Bu esa saratonning rivojlanishiga olib keladi [354;355]. CagA oqsili hujayra membranasiga yopishganda, hujayra membranasining o'tkazuvchanligini oshiradi. Bu esa hujayraning normal faoliyatini buzadi. Bu esa saratonning rivojlanishiga olib keladi. CagA oqsilining C-terminal qismi hujayra ichiga kirganda, u hujayra ichidagi signal yo'llarini o'zgartiradi. Bu esa hujayraning normal faoliyatini buzadi. Bu esa saratonning rivojlanishiga olib keladi [356;357].

Tarkibida CagA oqsilini kodlovchi **cagA geni** saqlovchi H. pylori shtammlari bemorlarda oshqozon yarasi va oshqozon saratoni rivojlanishi xavfini oshiradi. Ushbu shtammlar oshqozon epiteliy hujayralarida kuchli immunogen xususiyatga ega bo'lgan CagA oqsilini ishlab chiqaradi. Ushbu oqsilga nisbatan hosil bo'lgan antitanachalar oshqozon yarasi va oshqozon saratoni bilan kasallangan bemorlarda yuqori titrda aniqlanadi. CagA oqsilining C-terminal qismi turli xil shtammlarda bir-biridan farq qiladi. Ushbu qism oqsilning immunogen xususiyatini belgilaydi. CagA oqsilining N-terminal qismi esa barcha shtammlarda deyarli bir xil bo'lib, u oqsilning biologik faolligini ta'minlaydi. CagA oqsilining N-terminal qismi hujayra ichiga kirib, hujayra ichidagi signal yo'llarini o'zgartiradi. Bu esa hujayraning normal faoliyatini buzadi. CagA oqsilining C-terminal qismi hujayra membranasiga yopishganda, hujayra membranasining o'tkazuvchanligini oshiradi. Bu esa hujayraning normal faoliyatini buzadi. CagA oqsilining C-terminal qismi hujayra ichidagi signal yo'llarini o'zgartirib, hujayraning o'sishini va bo'linishini tezlashtiradi. Bu esa saratonning rivojlanishiga olib keladi. CagA oqsilining C-terminal qismi hujayra ichiga kirganda, u hujayra ichidagi signal yo'llarini o'zgartiradi. Bu esa hujayraning normal faoliyatini buzadi. Bu esa saratonning rivojlanishiga olib keladi. CagA oqsili hujayra membranasiga yopishganda, hujayra membranasining o'tkazuvchanligini oshiradi. Bu esa hujayraning normal faoliyatini buzadi. Bu esa saratonning rivojlanishiga olib keladi. CagA oqsilining C-terminal qismi hujayra ichiga kirganda, u hujayra ichidagi signal yo'llarini o'zgartiradi. Bu esa hujayraning normal faoliyatini buzadi. Bu esa saratonning rivojlanishiga olib keladi. CagA oqsilining C-terminal qismi hujayra ichiga kirganda, u hujayra ichidagi signal yo'llarini o'zgartiradi. Bu esa hujayraning normal faoliyatini buzadi. Bu esa saratonning rivojlanishiga olib keladi.

CagA oqsili hujayra membranasiga yopishganda, hujayra membranasining o'tkazuvchanligini oshiradi. Bu esa hujayraning normal faoliyatini buzadi. Bu esa saratonning rivojlanishiga olib keladi. CagA oqsilining C-terminal qismi hujayra ichiga kirganda, u hujayra ichidagi signal yo'llarini o'zgartiradi. Bu esa hujayraning normal faoliyatini buzadi. Bu esa saratonning rivojlanishiga olib keladi. CagA oqsilining C-terminal qismi hujayra ichiga kirganda, u hujayra ichidagi signal yo'llarini o'zgartiradi. Bu esa hujayraning normal faoliyatini buzadi. Bu esa saratonning rivojlanishiga olib keladi. CagA oqsili hujayra membranasiga yopishganda, hujayra membranasining o'tkazuvchanligini oshiradi. Bu esa hujayraning normal faoliyatini buzadi. Bu esa saratonning rivojlanishiga olib keladi. CagA oqsilining C-terminal qismi hujayra ichiga kirganda, u hujayra ichidagi signal yo'llarini o'zgartiradi. Bu esa hujayraning normal faoliyatini buzadi. Διάγραμμα 19. Ποσοστό γυναικών που χρησιμοποιούν αντισύλληψη σε διάφορες χώρες (Διάγραμμα Α΄ μέρους).

Σε αυτό το διάγραμμα βλέπουμε ότι σε κάθε χώρα που μελετήθηκε (Διάγραμμα Α΄ μέρους) η χρήση αντισύλληψης αυξάνεται με την ηλικία, αλλά η αύξηση αυτή δεν είναι η ίδια σε όλες τις χώρες. Στην Αιθιοπία, για παράδειγμα, η χρήση αντισύλληψης αυξάνεται πολύ αργά με την ηλικία, ενώ στη Φινλανδία η αύξηση είναι πολύ γρήγορη. Στη Σαγκάη (Κίνα) η χρήση αντισύλληψης αυξάνεται γρήγορα στις νεαρές ηλικίες, αλλά μετά τα 30 χρόνια η αύξηση είναι πολύ αργή. Στο Λονδίνο η χρήση αντισύλληψης αυξάνεται γρήγορα μέχρι τα 40 χρόνια και μετά η αύξηση είναι πολύ αργή.

- Η χρήση αντισύλληψης (όπως και άλλων συμπεριφορών) επηρεάζεται από τις **κοινωνικές νόρμες** που επικρατούν στην κοινωνία στην οποία ζει ένα άτομο. Οι κοινωνικές νόρμες είναι οι κανόνες που καθορίζουν τι είναι αποδεκτό και τι όχι σε μια κοινωνία. Στη Φινλανδία, για παράδειγμα, η χρήση αντισύλληψης είναι αποδεκτή από τους περισσότερους ανθρώπους, ενώ στην Αιθιοπία είναι αποδεκτή από λίγους.

- Η **διάδοση** είναι η διαδικασία με την οποία μια συμπεριφορά (όπως η χρήση αντισύλληψης) εξαπλώνεται από τους ανθρώπους που την υιοθετούν πρώτοι στους υπόλοιπους. Η διάδοση εξαρτάται από τις κοινωνικές νόρμες και από τις επικοινωνίες μεταξύ των ανθρώπων.

- Η **γενεά** (ή **κοόρτη**) (birth cohort effect) είναι ένα σύνολο ατόμων που γεννήθηκαν την ίδια περίοδο. Οι γενεές μπορούν να χρησιμοποιηθούν για να μελετήσουμε πώς αλλάζουν οι συμπεριφορές και οι στάσεις των ανθρώπων με την πάροδο του χρόνου. Για παράδειγμα, μπορούμε να συγκρίνουμε τη χρήση αντισύλληψης σε διαφορετικές γενεές για να δούμε αν η χρήση αντισύλληψης έχει αυξηθεί με την πάροδο του χρόνου. Η **γενεακή διάδοση** (generation or cohort phenomenon) είναι η διάδοση μιας συμπεριφοράς μεταξύ των μελών μιας γενεάς.

Ασθήνεια 20. Η μετάδοση της φυματίωσης (διάγραμμα) στην Αγγλία και την Ουαλία κατά τη διάρκεια του **20ού** αιώνα.

16. Η ΕΠΙΔΗΜΙΟΛΟΓΙΑ ΤΗΣ ΑΣΘΕΝΕΙΑΣ

Η επιδημιολογία της ασθένειας είναι η μελέτη των παραγόντων που καθορίζουν την εμφάνιση και τη διάδοση των ασθενειών στους πληθυσμούς των ανθρώπων και των ζώων. Η επιδημιολογία των ασθενειών των ανθρώπων (human pathogens) είναι η μελέτη της εμφάνισης και της διάδοσης των παθογόνων μικροοργανισμών που προσβάλλουν τον άνθρωπο, ενώ η επιδημιολογία των ζωονόσων (zoonotic pathogens) είναι η μελέτη των ασθενειών που μεταδίδονται από τα ζώα στον άνθρωπο.

Βασικές αρχές της Επιδημιολογίας της Ασθένειας

Η επιδημιολογία της ασθένειας βασίζεται στην αρχή ότι η εμφάνιση μιας ασθένειας σε έναν πληθυσμό δεν είναι τυχαία, αλλά καθορίζεται από συγκεκριμένους παράγοντες. Αυτοί οι παράγοντες μπορούν να χωριστούν σε τρεις κατηγορίες: τον παθογόνο μικροοργανισμό, τον ξενιστή και το περιβάλλον. Ο παθογόνος μικροοργανισμός είναι ο μικροοργανισμός που προκαλεί την ασθένεια, ο ξενιστής είναι ο οργανισμός που προσβάλλεται από τον παθογόνο μικροοργανισμό, και το περιβάλλον είναι το φυσικό και κοινωνικό περιβάλλον στο οποίο συμβαίνει η μετάδοση της ασθένειας [443;444]. Ο West και οι συνεργάτες του [445;446]. Η μετάδοση της φυματίωσης μπορεί να μειωθεί σημαντικά με τη βελτίωση των συνθηκών διαβίωσης, όπως η καλύτερη διατροφή, η βελτίωση της υγιεινής και η μείωση του συνωστισμού.

ελίσσεται PCR μολύνσεις αναπνευστικού συστήματος (Μολυσματική Νοσηλευτική) [454-457]. Η εργασία, η οποία διεξήχθη στο Νοσοκομείο Shahamat της πόλης. Χρησιμοποιήθηκαν δείγματα DNA που απομονώθηκαν από [3η] φοιτητές, οι οποίοι επιλέχθηκαν με τυχαία δειγματοληψία. Τα δείγματα διατηρήθηκαν στους 4° C, πριν από την εξαγωγή DNA και στη συνέχεια αποθηκεύτηκαν στους -20° C. Η ποσότητα του DNA που χρησιμοποιήθηκε ήταν περίπου 10^8 μονάδες CFU/ml και η θερμοκρασία ανόπτησης ήταν [3η] φοιτητές. Τα αποτελέσματα δείχνουν ότι η ευαισθησία και η ειδικότητα της μεθόδου PCR ήταν 100% και 98% αντίστοιχα [458].

Τεχνικές μοριακής βιολογίας

Η μοριακή βιολογία είναι ένας κλάδος της βιολογίας που ασχολείται με τη μελέτη της δομής και της λειτουργίας των βιολογικών μακρομορίων, όπως το DNA, το RNA και οι πρωτεΐνες, καθώς και με τις αλληλεπιδράσεις μεταξύ αυτών των μορίων και άλλων κυτταρικών συστατικών. Η μοριακή βιολογία είναι ένα πολύ ευρύ πεδίο που περιλαμβάνει πολλές διαφορετικές τεχνικές και μεθόδους. Μερικές από τις πιο κοινές τεχνικές μοριακής βιολογίας περιλαμβάνουν την αλληλούχιση DNA, την κλωνοποίηση DNA, την αντίδραση αλυσιδωτής πολυμεράσης (PCR), την ηλεκτροφόρηση γέλης και την ανάλυση πρωτεϊνών [459-462]. Η αλληλούχιση DNA είναι η διαδικασία προσδιορισμού της ακολουθίας νουκλεοτιδίων στο μόριο του DNA. Αυτό μπορεί να γίνει χρησιμοποιώντας μια ποικιλία διαφορετικών μεθόδων, συμπεριλαμβανομένης της αλληλούχισης Sanger και της αλληλούχισης επόμενης γενιάς. Η κλωνοποίηση DNA είναι η διαδικασία δημιουργίας πολλαπλών αντιγράφων ενός συγκεκριμένου τμήματος DNA. Αυτό μπορεί να γίνει χρησιμοποιώντας μια ποικιλία διαφορετικών μεθόδων, συμπεριλαμβανομένης της κλωνοποίησης φορέα και της κλωνοποίησης PCR. Η αντίδραση αλυσιδωτής πολυμεράσης (PCR) είναι μια τεχνική που χρησιμοποιείται για την ενίσχυση συγκεκριμένων τμημάτων DNA. Αυτό μπορεί να γίνει χρησιμοποιώντας μια ποικιλία διαφορετικών μεθόδων, συμπεριλαμβανομένης της PCR σε πραγματικό χρόνο και της PCR με μετατροπή αντίστροφης μεταγραφής [463;464]. Η ηλεκτροφόρηση γέλης είναι μια τεχνική που χρησιμοποιείται για το διαχωρισμό μορίων DNA με βάση το μέγεθός τους. Αυτό μπορεί να γίνει χρησιμοποιώντας μια ποικιλία διαφορετικών τύπων γέλης και συστημάτων ηλεκτροφόρησης. Η ανάλυση πρωτεϊνών είναι η διαδικασία προσδιορισμού της δομής και της λειτουργίας των πρωτεϊνών. Αυτό μπορεί να γίνει χρησιμοποιώντας μια ποικιλία διαφορετικών μεθόδων, συμπεριλαμβανομένης της φασματομετρίας μάζας και της κρυσταλλογραφίας ακτίνων Χ.

Μετάδοση μολυσματικών παραγόντων

Η μετάδοση μολυσματικών παραγόντων (person to person) [346;465]. Αυτό μπορεί να συμβεί μέσω διαφόρων οδών, όπως η σταγονική μετάδοση, η μετάδοση μέσω επαφής και η μετάδοση μέσω μολυσμένων αντικειμένων. Η σταγονική μετάδοση συμβαίνει όταν ένα άτομο βήχει ή φτερνίζεται, απελευθερώνοντας σταγονίδια που περιέχουν τον παθογόνο παράγοντα στον αέρα. Η μετάδοση μέσω επαφής συμβαίνει όταν ένα άτομο αγγίζει μια μολυσμένη επιφάνεια και στη συνέχεια αγγίζει το στόμα, τη μύτη ή τα μάτια του. Η μετάδοση μέσω μολυσμένων αντικειμένων συμβαίνει όταν ένα άτομο χρησιμοποιεί ένα αντικείμενο που έχει μολυνθεί από τον παθογόνο παράγοντα, όπως μια βελόνα ή ένα σύριγγα. Η μετάδοση μολυσματικών παραγόντων μπορεί να προληφθεί με διάφορα μέτρα, όπως το πλύσιμο των χεριών, η χρήση γαντιών και η αποφυγή στενής επαφής με μολυσμένα άτομα (close contact).

Όπως, είναι γνωστό, οι μοριακές τεχνικές έχουν φέρει επανάσταση στον τρόπο με τον οποίο μελετάμε και κατανοούμε τα βιολογικά συστήματα. Αυτές οι τεχνικές μας επιτρέπουν να αναλύουμε το DNA, το RNA και τις πρωτεΐνες με πρωτοφανή λεπτομέρεια και ακρίβεια, οδηγώντας σε σημαντικές προόδους στην κατανόησή μας για τις ασθένειες, την ανάπτυξη και την εξέλιξη. Μερικές από τις πιο σημαντικές μοριακές τεχνικές περιλαμβάνουν την αλληλούχιση DNA, την αντίδραση αλυσιδωτής πολυμεράσης (PCR), την ηλεκτροφόρηση γέλης και την ανάλυση πρωτεϊνών. Η αλληλούχιση DNA είναι η διαδικασία προσδιορισμού της ακολουθίας νουκλεοτιδίων στο μόριο του DNA. Αυτό μπορεί να γίνει χρησιμοποιώντας μια ποικιλία διαφορετικών μεθόδων, συμπεριλαμβανομένης της αλληλούχισης Sanger και της αλληλούχισης επόμενης γενιάς. Η αντίδραση αλυσιδωτής πολυμεράσης (PCR) είναι μια τεχνική που χρησιμοποιείται για την ενίσχυση συγκεκριμένων τμημάτων DNA. Αυτό μπορεί να γίνει χρησιμοποιώντας μια ποικιλία διαφορετικών μεθόδων, συμπεριλαμβανομένης της PCR σε πραγματικό χρόνο και της PCR με μετατροπή αντίστροφης μεταγραφής. Ověření nové biprobe sondy pro detekci mutace v genu 23S rRNA H. pylori metodou Real Time PCR s následnou křivkou tání

Pro účely této práce byla použita *in vitro* diagnostická souprava (IVD) obsahující biprobe sondu ClariRes Assay© firmy Ingenetix, Vienna, Austria [541] pro detekci mutace v genu 23S rRNA *H. pylori* (**Příloha č. 22**). Bodová mutace A-to-G (transition A-to-G) na pozici 2142 a bodová mutace 2143 a bodová mutace A-to-C na pozici 2142 23S rRNA. Biprobe sondy obsahují fluorofor Cy5. Sonda je navržena tak, že v případě přítomnosti mutace dochází k uvolnění fluoroforu Cy5 od zhášeče, čímž se Cy5 stane fluorescenčně aktivní. Pro detekci dvojřetězcové DNA byl použit SybrGreen I, který se váže na malý žlábek dvojřetězcové DNA. Pro izolaci DNA z bioptických vzorků byla použita souprava Nucleospin Tissue XS© (Extra Small) [542] firmy Macherey-Nagel, Duren, Germany. Pro detekci mutace v genu 23S rRNA *H. pylori* CCUG38771 byl použit wild type 23S rRNA a bodové mutace *H.pylori* 825, 683 a 677 na pozici 2142C, A2142G a A2143G na 23S rRNA genu **pomocí real time PCR** [543]. Celý 20 µl PCR roztok obsahoval 2 µl LightCycler FastStart DNA Master SYBR green I (Roche Molecular Biochemical, Mannheim, Germany), 2.4 µl 4 mM $MgCl_2$, 12.1 µl PCR-grade vody, 0.5 µl *H. pylori* ClariRes© Assay solution (Ingenetix, Vienna, Austria), 1 µl templátové DNA (<1 µg) nebo pozitivní control (Ingenetix, Vienna, Austria) a 2 µl vody pro negativní kontrolu. Každý vzorek byl testován ve dvojím stanovení. Primer 23S-F (5'-AGATGGGAGCTGTCTCAACCAG-3', pozice 2437-2458, byl navržen na základě GeneBank U27270, 0.25 µM 23S-R (5'-TCCTGCGCATGATATTCCC-3'), pozice 2573-2555, byl navržen na základě GeneBank U27270 a bylo použito 0.2 mM množství značené 23S-S (5'-Cy5-AAGACGGAAAGACCCCGT-biotin-3'), pozice 2507-2524, byl navržen na základě GeneBank U27270.

Hình 24. Tín hiệu phát huỳnh quang của đối chứng nội (internal positive control) được đặt ở 47^0C trong kênh F3 (được phân tích bằng Roche LightCycler©, phần mềm version 3.5.3)

Định lượng tương đối Q-RT-PCR (quantitative RT-PCR) của gen ức chế enzym chuyển (ACE) trong tế bào nội mô mạch máu (HUVEC)

Phản ứng được thực hiện trong máy LightCycler 2.0 gồm tổng thể tích 20 µl với 10 µl dung dịch đệm 1 µl Faststart DNA Cybergreen I (Roche Molecular Biochemicals), 1.5mM $MgCl_2$, 0.5 mM dung dịch primer (HP-FOR, 5'-TTATCGGTAAAGACACCAGAAA-3' và HP-REV, 5'-ATCACAGCGCATGTCTTC-3) và 5 µl cDNA (1-25 ng). Chương trình được thực hiện với 10 phút ở 95^0C, (gồm 1 chu kỳ với tốc độ 20^0C/s), tiếp theo là 40 lần lặp lại chu kỳ với 94^0C trong 10 seconds (gồm 1 chu kỳ với tốc độ 20^0C/s), tiếp theo là 54^0C trong 5 seconds (gồm 1 chu kỳ với tốc độ 20^0C/s), cuối cùng là 72^0C trong 8 seconds (gồm 1 chu kỳ với tốc độ 20^0C/s) và cuối cùng là 77^0C trong 5 seconds (gồm 1 chu kỳ với tốc độ 20^0C/s). Và lưu trữ ở 4^0C trong 1 phút.

Ở giai đoạn 1 chu kỳ ta thu được giá trị Cp (Crossing point) là điểm mà tại đó cường độ phát quang bắt đầu tăng lên đáng kể so với nền. Giá trị này tỉ lệ nghịch với lượng DNA ban đầu có trong mẫu. Nghĩa là mẫu có lượng DNA ban đầu càng nhiều thì giá trị Cp càng nhỏ và ngược lại mẫu có lượng DNA ban đầu càng ít thì giá trị Cp càng lớn (**Hình 29**).

Ábra 39. Egészséges bőr és *Acanthamoeba* fertőzött szövet (Fényképezőgép csatlakoztatva Olympus GiemsaX100 fényszűrővel, nagyítás 100)

Histológiai vizsgálat

Összesen 150 szövetmintát vizsgáltunk meg Sydney városában:

- Ezek közül 80 szövetben találtunk *Acanthamoeba* fertőzést (ebből 53 esetben *A.castellanii*, míg 27 esetben *A.polyphaga* fertőzést igazoltunk), 53 esetben *Fusarium* fertőzést (35,1%) és 7 esetben egyéb fertőzést (4,6%)

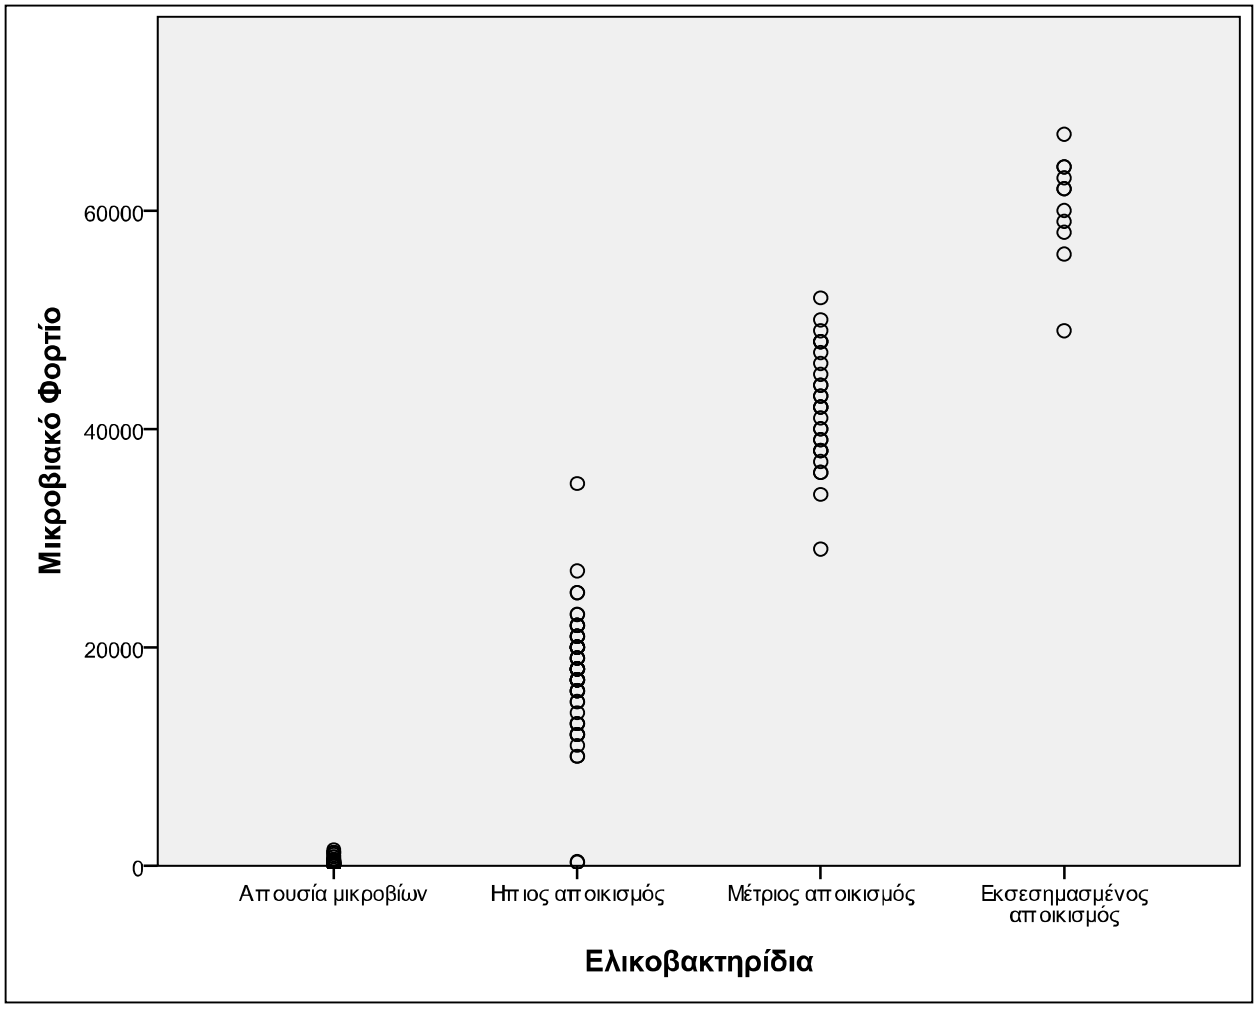
Ε ύμφωνα με τα **Διάγραμμα 49** ύψη των μικροβιακών φορτίων των δειγμάτων που ανήκουν στα γενότυπα Sydney. Η μεταβλητή που αντιστοιχεί στον άξονα Q-RT-PCR μας δίνει



Διάγραμμα 49. Διάγραμμα ανάμεσα στα γενότυπα και στα επίπεδα μικροβιακού φορτίου Q-PCR που ανιχνεύθηκαν στα **δείγματα** του γενότυπου Sydney

Η μεταβλητή που αντιστοιχεί στον άξονα των τεταγμένων μας δίνει τα cut-off points από 30.000 έως 50.000 μικροβιακά αντίγραφα ανά γραμμάριο κοπράνων. Αν θέλουμε να μετατρέψουμε τα αντίγραφα σε λογαριθμική κλίμακα με βάση το 10 θα πρέπει να χρησιμοποιήσουμε τον τύπο Q-RT-PCR που δίνει η παρακάτω εξίσωση

ABSTRACT

Molecular detection of *H. pylori* macrolides-resistance strains in archival material and correlation with histological data according to Sydney classification

Sofia Gazi, Biologist, PhD thesis

Introduction. *Helicobacter pylori* (*Hp)* is a spiral, microaerobic, gram negative bacterium that infects gastric mucosa with a prevalence rate more than 50% and is associated with different digestive diseases such as gastritis, peptic ulcer and neoplasia as MALT lymphoma and gastric carcinogenesis. The progression of these diseases is affected by the genotype of the organism, the immune response of the host, as well as by genetic and environmental influences. As a consequence, all consensus guidelines recommend eradication of *Hp* for patients with symptoms. Standard therapy combines a proton pump inhibitor (PPi), or ranitidine bismuthe citrate and two antibiotics chosen among Amoxicillin, Clarithromycin and Metronidazole. Many factors have been implicated as causes of treatment failure, and among them are certain genetic changes in terms of point mutations in the peptidyltransferase region of the domain V of the 23S rRNA of *Hp,* connected particularly with Clarithomycin resistance.

Aim. The focus of this study was to evaluate these genetic changes in formalin-fixed paraffin embedded biopsies of *Hp*+ patients and to correlate them with various phenotypic changes expressed by Sydneyôs classification parameters.

Material and Methods. A total of 150 *Hp*(+) gastritis cases (biopsies-paraffin blocks) were studied, taken from 75 patients divided in 2 groups: group A consisted of 25 Clarithromycin-resistant *Hp*(+) gastritis patients and group B consisted of 50 *Hp*(+) gastritis patients where successful eradication was achieved. Histologic classification was done according to Sydney criteria in bioptic material obtained before and after *Hp*(+) gastritis therapy. In most of the cases adequate quantity of DNA was extracted from archival bioptic material and analyzed in a Roche LightCycler© RT-PCR thermocycler, using the recently introduced *Hp* ClariRes© kit (Ingenetix, Vienna, Austria), for the determination of point mutations in the 23S rRNA gene, responsible for Clarithromycin resistance. At the same time, a Real Time Quantitative PCR was also performed using the same cycler at the same DNA, in order to determine the absolute number of *Hp* bacteria per clinical sample.

Results. Our results revealed that in most of the Clarithomycin resistance cases of group A (16/25), certain point mutations at sites A2142C, A2142G and A2143G of the 23S rRNA had occurred. In some cases among group A patients, it was shown that mixed infections with both susceptible and resistant *Hp* strains had also occurred. Seven (7) cases from group A patients showed no mutations at all. A coexistence of mutated and wild type cases in 3 out of 50 *Hp*+ patients before therapy were observed in group B. A statistically significant association among almost all Sydney classification parameters (except atrophy) and genetic alterations in 23S rRNA of *Hp* were noticed. Furthermore, a strong correlation between genetic alterations and age of the patients was revealed, as well as between genetic alterations and the sites from where the biopsies were obtained (antrum, corpus, cardia, angle, and fundus). No correlation was observed between genetic status and absolute number of bacteria per clinical case as defined by Q-RT-PCR. *Hp* quantity correlates well with bacterial colonization as described histologically in Sydney classification.

Conclusion. In conclusion, it seems that *Hp* is a rather genetically complicated microorganism, the biological and clinical behavior of which is largely affected by the host. Enhanced risk may be related to differences in expression of specific bacterial products, to variations in the host inflammatory response to the bacteria, or to specific interactions between host and microbes. Genes that are heterogeneously represented among *Hp* strains, however, may encode candidate virulence factors that influence the pathological course. *Hp* genome is largely characterized by genetic variability that permits the survival of the bacterium in a quite hostile environment. This genetic diversity affects the response of *Hp* in the followed treatment strategies, and alters the phenotype of the gastric mucosa environment, as this reflected in Sydney classification. So our findings in this study confirm the relevance of the *Hp* genotypes for the severity of gastric disease and the efficacy of antibiotic therapy to further prevent the (possible) progression to carcinogenesis or lymphomatogenesis.
